Director, Institute for Public Policy and Business Research

Acknowledgements

This is the second survey conducted to study employer perceptions of the state's workforce. The first survey was completed in 1989 and was funded by Kansas, Inc. and the Kansas State Department of Education. The 1996 research was funded by Kansas, Inc. We would like to thank Charles Warren for his input and assistance. We would also like to thank the 600 businesses in Kansas who participated in the survey. Larry Hoyle and Kevin Nelson conducted the survey, Laura Poracsky provided graphic design assistance, and Jennifer Stewart provided word processing assistance for this report.

EXECUTIVE SUMMARY

In 1989, an IPPBR/Kansas, Inc. study asked employers to assess the skills of the Kansas workforce, both basic academic skills and other skills needed to meet job requirements. Firms reported that employees needed to improve skills. Since that time, many changes have occurred in the way work is performed and in the way students are educated. Have changes in education produced students who enter the workforce with skills that match job skill requirements? Has the rapid pace of technological change outstripped the rate of improvement in workers' skills? The purpose of the present study was to survey owners or managers of Kansas firms to determine whether employers' perceptions of the Kansas workforce changed from 1989 to 1996.

METHODOLOGY

A telephone survey (similar to that conducted in 1989) asked 600 Kansas firms questions about the training and competence of new hires and present employees, future training requirements, and the utilization and quality of training programs. Firms surveyed represented manufacturers and nonmanufacturers, firms of different sizes (small, medium, and large), and firms in different settings (rural, mid-sized, and urban counties).

RESULTS

The results of the survey confirmed that employers needed employees with good basic skills (reading, writing, computation), technical skills, and work habits. Finding workers with these skills has become increasingly difficult and will become even more difficult in the next two to three years. Skill requirements for entry level jobs increased over the past five years, but skills of newly hired employees have not kept pace. Most employers required a minimum of a high school diploma, but expected changes in technology over the next two to three years to increase the level of technical/vocational skills employees will need. Employers described the gap between job requirements and workers' qualifications as slight to moderate, and predicted that gap would increase. Firms also predicted that technological changes would increase the level of technical skills required.

High school graduates were not adequately prepared to add productive value to firms. While high school students' skills were less than adequate in meeting businesses' needs, employers reported that they were satisfied with those trained at community colleges, AVTSs, and universities. When asked what skills newly hired employees needed to improve, employers focused upon basic skills (listening/oral communication, writing, computation), thinking skills (problem solving, decision making, comprehension, creative thinking, willingness to learn), and personal qualities (work habits, goal setting/personal motivation, leadership, teamwork, interpersonal relations, adaptability). Technical skills such as computer and business/management skills also needed improvement. Employers also reported that current employees needed to improve skills. To help improve employee skills, approximately half the firms used technical/

vocational training programs in the past five years and most paid for that training. Most firms would consider paying higher wages, up to 10 percent more, to workers with higher skills.

IMPLICATIONS

That workers' skills do not meet job skill requirements was the overriding finding of this report. The pace of change, driven by technological advances and changes in how work was organized, continued to outstrip the rate at which workers' skills improved. Educators, employers, and employees have been chasing, and will continue to chase, a moving target. This has serious implications for Kansas and requires a serious, committed response at all levels of private and public activity.

1. Development of a highly skilled workforce must continue to be a strategic objective for Kansas economic development.

The workforce is a state strength, but it is also a weakness. Kansas does not have a large reservoir of unemployed or underemployed skilled workers. In fact, regional shortages of skilled workers exist. Similar shortages exist nationwide, so the state cannot solve labor shortages or skill deficits by importing labor from other states. Ways must be found to better utilize the existing population. Skills must be improved through training and retraining and those not currently in the work force must be encouraged to enter or re-enter the labor market. Employers must commit resources to train and retrain their current employees, both in basic academic skills and technical skills.

The state's education and training system must have the institutional capability to provide training for workers to upgrade existing and develop new skills as job skill requirements change. Institutions must have the capability to meet the workforce's training needs, from the production worker who needs to improve communication and math skills to the computer programmer or engineer who needs to keep abreast of cutting edge technology. The state must have a quality educational system that includes K-12, technical training and associate degree programs, baccalaureate programs, and post-graduate programs to produce and maintain the quality workforce needed by Kansas businesses which must do business in the new, competitive, global economy. Post-secondary institutions, especially community colleges, must encourage employers and employees to access training to improve basic academic skills and technical skills by providing classes that meet the needs of nontraditional students and customized training that meets the needs of businesses. Educators and government officials must focus upon removing barriers

¹See the 1996 Kansas Strategic Plan, Kansas, Inc., for a thorough discussion of a broad range of workforce issues.

created by a fragmented training system.² Duplication of training within the training system must be reduced so savings that result can be used to provide advanced equipment for training programs.

Current workforce problems will require both private and public action to solve existing and future challenges, but that can happen because Kansas has a history of solving problems through private-public cooperation. Employers, workers, parents of students, students, educators, and government officials at the community as well as the state level must understand that their prosperity depends upon their commitment to developing a skilled workforce. Employers must commit resources to train and retrain their current employees, both in basic academic skills and technical skills. Students, supported by parents and educators, must develop good work attitudes and habits in school and transfer those skills to the workplace. Students, and their parents, must also realize that post-secondary training is essential and life long learning will be necessary to develop new and upgrade existing technical skills. While college education is not required for all, some form of technical/vocational training in apprenticeship programs or at community colleges and AVTSs is required.

2. Educators, supported by parents and employers, must provide business and industry with workers who add productive value to the firms which employ them.

Educators, supported by parents and employers, must continue to improve curriculum, focus on educational outcomes, and demand high standards for high school graduation. The K-12 education system should continue to focus upon improving the skills of its students. Business needs students to develop competency in basic skills (e.g., reading, writing, computation, communication), thinking skills (e.g., problem solving, decision making, etc.), and personal qualities (e.g., work habits, teamwork, etc.). Schools should continue to focus upon outcome measures and make certain high standards are set. Students seeking a high school diploma must meet high performance standards and demonstrate competency in a set of basic skills, thinking skills, and personal work habits. The curriculum must not be too loose and undemanding or the average student will not be prepared to meet the increasingly sophisticated needs of business and industry. The K-12 system must prepare non-college bound students for post-secondary technical training and associate degree programs as well as it prepares students who seek admission to four-year baccalaureate programs.

:

²Krider, C.E., Redwood, A.L., & Stella, M.E. Kansas Workforce Employment and Training Programs: Do They Function as a System? Institute for Public Policy and Business Research, University of Kansas, 1994.

3. Business and industry needs to communicate job skill requirements to educators on a continuous basis.

Business must communicate to educators what job skills are required. While donating funds or items to support academic and extracurricular activities is important, the role of business could evolve toward providing more frequent and effective support and feedback to teachers and educators. Educators need to know more about the quality of the product they produce (i.e., the students). Is the client (i.e., the employer) happy with the quality of the product or (if it were like other products) would it be returned for repairs or replacement? How well prepared are **average** students to enter the workplace? Are they prepared to go to work, or are they entering the work world lost and unprepared.

Schools get frequent and useful feedback about the performance of their college-bound students through college entrance exam scores and college placement rates. Similar feedback is not available for non-college bound students. Educators and the business community in each school district should consider what this lack of feedback is costing the community. Are businesses less competitive due to poorly trained workers? If businesses become less competitive and fail, what is the loss to the school district in terms of lost revenue? When these costs are examined, perhaps both educators and businesses will realize effective, working partnerships which provide feedback and improve training are a good investment. Information exchange should focus upon how the nature of work is changing -- what impact technology or new management practices have on job skill requirements.

4. The business community and the education system must commit to developing effective business-education partnerships.

Business-education partnerships should be created and strengthened in every community in Kansas. What is an effective working partnership? Each community must decide what works. However, several elements should be considered. The partnerships must evolve so the K-12 education system does not continue to produce graduates who add little productive value to the firms which employ them. Business-education partnerships must focus upon developing technical preparation programs and school-to-work programs that produce students who are ready to enter the labor market with skills needed by employers. This will require the business community to become more familiar with current educational practices and teachers to become more familiar with the workplace. Are teachers familiar with and comfortable in non-educational work settings? Can teachers participate in summer programs, internships, or sabbatical programs in business and industry that prepare them to train students for high-skill, high-wage jobs? Do teachers (and their students) have access to hands-on experiences in business and industrial settings? Do teachers get credit (in terms of promotion, salary, etc.) for such training in the same way that they get credit for attending education classes at colleges and universities? Are there communities in this state and in neighboring states where business-education partnerships are providing this type of information exchange and teacher support? Other communities may find it useful to examine how

those partnerships evolved so they can begin to develop effective partnerships in their own communities.

5. Inform students and parents of post-secondary training options.

Parents and students must realize that some form of post-secondary education or training is essential and that many options are available. For students who do not wish to enter a four-year degree program, other options must be available and well publicized. Guidance counselors must be prepared to help these students and their parents learn about school-to-work programs, apprenticeship programs, two-year associate degree programs, and technical training programs. Students must have available to them a coordinated system which provides quality training and allows credit for training in one part of the system (e.g., community college) to count in another part of the system (e.g., university) as their training goals change. As clients of the education system, students should be assured that the system will be flexible enough to recognize skills developed on the job and not require training or course work in areas where competency already exists.

6. Create tech prep programs, school-to-work programs, and apprenticeship programs that are academically sound and linked to the business world.

Businesses and industries in desperate need of more qualified workers and unhappy with new recruits from the state's secondary schools must support and invest in training high school students through apprenticeship programs and other programs that link school to jobs. Teachers and employers must work together to develop courses that develop necessary skills and demand high performance levels. Working together, employers and teachers can share information and solve problems regarding curriculum (i.e., what skills need to be trained), performance evaluation (i.e., student grades), quality issues (i.e., how to improve low grades or unacceptable performance). Involvement at the level of the teacher, not just at the level of the administrator (e.g., principal or state curriculum planning committees), may benefit all. Businesses communicate their needs directly, teachers get support, and students are given a reason to learn by making their academic courses relevant to their lives and focused upon the need for quality performance.

The state has been moving too slowly in this area. Lack of or weak tech prep programs contribute to the serious gap between job skill requirements and the skills of the young worker. Every school district should have a serious, high-quality tech prep program by the year 2000. Tech prep programs are not old vo-tech programs with new names. Serious, high-quality tech programs should be linked to two-year technical training or associate degree programs so students receive the post-secondary technical training that current and future jobs require.

7. Support Adult Basic Education (ABE) to enable those who have already left the education system improve their basic skills.

Many workers or potential workers in Kansas have basic skills (reading, math, writing, communication) which are under- or undeveloped. These people may have graduated many years ago, may have completed high school last year, may have dropped out of high school, or may be entering the job market because of welfare reform. ABE programs need to be a higher priority in Kansas. Instead of asking what is the least amount of state dollars needed to receive Federal support for these programs, the state needs to adopt a more strategic view and invest at levels that address the need for ABE created by older workers as well as welfare reform and school drop outs. Currently ABE programs focus upon those preparing to take GED tests. Resources barely meet those needs, so programs have difficulty serving those who need to upgrade basic skills but do not need a GED.³ With adequate funding, ABE programs provide support for those seeking to improve basic skills.

INTRODUCTION

Kansans, like people all over the world, want to prosper. Individual and family prosperity and quality of life depends upon the ability to earn good wages, whether as an employee or as an employer. A more competitive global economy places Kansans in competition with other states and other countries for jobs and industries that pay good wages. Those states and countries that are competitive attract high-skill, high-wage jobs and acquire or retain their position as First World economies. Those that are not competitive are left with low paying, labor-intensive jobs and remain or become Third World economies.

Competing in the global economy has changed the way business does business. Some businesses have adapted to global competition through technological innovation and through new business practices that require employees to assume more management and problem-solving responsibilities. However, not all businesses have made the transition. Some are unable or unwilling to invest in technology or to alter old management practices. A business's ability to adapt to a more competitive, global economy may directly affect its survival. Those who adapt improve their chances of survival in a very competitive marketplace.

The quality of the Kansas workforce critically affects the competitiveness of Kansas businesses. A well-trained, efficient, dedicated workforce supports and strengthens business productivity and thus strengthens the state's economy. Since wages are based upon productivity, wages provide a measure of competitiveness. Kansas wage rates lag behind national rates. Kansas ranks thirty-fifth in average annual pay and thirty-fourth in average annual pay growth. A recent survey found that 11.2 percent of the Kansas labor force had more than one job. This is well above the national average of 6.3 percent. These findings confirm that, for many Kansans, one job does not provide adequate income.

The reasons for low wages and lagging productivity need to be identified. Are low wages and lagging productivity due to low skill levels of the workforce? Based upon high school graduation rates (percent of students graduating), high school attainment (number of citizens who have already graduated from high school), and college attainment scores (number of citizens who have graduated from college), Kansas was given a B in Human Resources. These measures of education levels suggest that the Kansas workforce should be well trained, if the education system and its students are doing their jobs. The state's K-12 system, parents, and students are responsible for producing workers with skills that businesses require. The post-secondary system

and other training providers must furnish adult basic education, technical training, and retraining to workers whose competitiveness depends upon life-long education.

If workers have attained a high school degree, does that mean they are productive workers? Do the workers have the skills necessary to perform high-skill jobs that pay high wages? Kansas is experiencing the trend seen nationwide: skill requirements within occupations are increasing. Demand for workers with more education and higher skills is driven by two forces:

- The application of technology across a wide array of occupations; and
- Changes in how work is organized.

For example, introduction of technology such as computers increases the skills required of employees. Clerical workers must master the use of computers, word processing and database software, electronic mail, and Internet usage. Those employed in manufacturing must understand complex robotics and computer-aided manufacturing. Workers in all types of businesses are also facing increased responsibility as many firms operate with fewer levels of management in order to be more efficient and competitive.

To survive in increasingly competitive global markets, businesses are replacing mass production and its long production runs with high performance work places characterized by:

- Flexible and decentralized production techniques;
- Employee empowerment (more decision making, wages tied to skills and education);
- Strong emphasis on excellence, on continually improving work performance, and on management for quality to reduce rework, increase customer satisfaction, and cut costs;
- Continual training to upgrade employee skills and ability to function effectively and efficiently in a problem-oriented environment; and
- Increasing integration of tasks through work teams which are responsible for the products or services they produce.

Employees who function in high performance work places must be well trained, flexible, assume decision making responsibilities, solve problems, work as a team, produce high quality goods and services, and constantly learn or improve skills.

While scores on academic tests and high school graduation rates are important, they do not provide a comprehensive measure of a state's human resources because they do not measure the other, higher-order skills (e.g., problem solving, teamwork, flexibility, etc.) required by high-skill, high-wage jobs. In 1989, an IPPBR/Kansas Inc. study measured employers' assessment of the Kansas workforce's skills, both basic academic skills as well as those other skills needed to survive in the new economy. Kansas business firms were surveyed to establish an empirical

database of employer's assessment of the skill level and training needs of the workforce. Firms reported that employees, whether seeking their first job or already in the workforce, needed to improve skills. The ten skills identified most frequently as needing improvement in 1989 were:

- Goal setting and personal motivation skills;
- 2. Proper attitudes toward work and work habits;
- Organizational effectiveness and leadership skills;
- 4 Listening and oral communication skills;
- Problem solving skills;
- 6. Team skills:
- Adaptability and flexibility;
- Comprehension and understanding skills;
- Interpersonal relations; and
- 10. Writing skills.

Responses to the survey also revealed that firms expected technological changes to increase the skills needed by workers. Employers reported difficulty in finding skilled employees and that finding skilled workers would become more difficult in the near future.

While statistics showed Kansas had a well-educated workforce, as measured by high school graduation, the 1989 survey results suggested that students who had completed high school did not enter the workforce with skills developed to the extent desired or required by employers. Since 1989, changes have occurred at the state and local level in the education system and the employment and training system. In 1991, the State Board of Education adopted Quality Performance Accreditation (QPA), which required schools to demonstrate student performance in basic skills (reading, writing, math, social studies, and science) through state assessments. QPA also encouraged schools to focus on "higher order" skills (communication, problem-solving, critical thinking, interpersonal skills). All Kansas public schools are in the QPA process, but not all have experienced the complete cycle of evaluation. Reading, writing, and math assessments have been fully implemented, but science and social studies are still in development stages. Other changes included the 1992 School Finance Act, which increased funding for schools, lengthened the minimum school year, required the development of state curriculum standards and assessments, and created site councils. In addition, many schools and teachers implemented

⁷Charles E. Krider, M. Elizabeth Stella, Genna Ott, and Ron Ash. Workforce Training: The Challenge for Kansas. Topeka, Kansas: Kansas, Inc., 1989.

⁸Schools collect baseline data on student performance, identify areas needing improvement, design a plan to improve student performance, implement the plan, measure change in student performance. Once performance improves in targeted areas, new areas and goals are identified and the cycle repeats.

⁹Site councils are composed of parents, business leaders and educators to advise local school boards on improvement strategies for each school in the state.

teaching strategies to help students develop problem solving skills, learn to work in teams, and apply academic skills to real world problems.

Have these changes produced students who enter the workforce with skills required by employers? Has the rapid pace of technological change outstripped the rate of improvement in student and worker skills? The state is in a unique position to monitor changes in employers' perceptions of workforce skills and training needs that have occurred since 1989. The purpose of the present study was to survey owners or managers of Kansas firms to determine:

- 1. Have employers' perceptions of the Kansas workforce changed from 1989 to 1996?
- 2. In what areas have workforce skills improved?
- 3. In what areas have workforce skills not improved or have deteriorated?
- 4. Have job skills and business needs increased? If so, in what areas?
- 5. What minimal education requirements do businesses require of entry level positions?
- 6. Are private firms increasing their investment in training and retraining of their employees? If yes, how? If no, why not?
- 7. How effective is the education and training system in meeting employer needs?
- 8. Are retraining programs available, accessible, and effective?

METHODOLOGY

Survey Sample

Sampling procedures used in 1989 were replicated. A computer database of 63,968 firms furnished by the Kansas Department of Human Resources (KDHR) was used to select businesses to be surveyed. Certain businesses were eliminated on the basis of SIC code (Personal Services, Miscellaneous Retail, Eating and Drinking Places, Food Stores, and Membership Organizations), and no businesses with fewer than five employees were surveyed. This eliminated over half or 37,292 firms, leaving 26,676 firms. A stratified random sample was drawn from the remaining firms to produce a list of 2,488 firms to contact. The sampling strategy was designed to produce a sample with equal numbers of manufacturing (300) and non-manufacturing (300) firms (Table 1) to permit inferences about each separately. As compared with the actual distribution of firms in Kansas, this sample was over-weighted for manufacturing, medium, and large firms, due to the smaller number of firms in those categories in the KDHR database. Kansas is the land of small, non-manufacturing businesses. Firm size was defined as small (five to 49 employees), medium (50 to 250 employees), and large (251+ employees). Of the 600 firms completing the survey, 250 were small, 239 were medium, and 111 were large. Firms completing the survey were located in

4

¹⁰In 1989, firms with fewer than five employees or firms of certain types were eliminated on the basis that the likely impact of such firms in terms of usage of technical and vocational facilities would be low.

rural counties, mid-sized counties, and urban counties. ¹¹ Mid-sized counties were those that were neither urban or rural relative to Kansas' population but had a city with a population between 10,000 and 50,000.

Survey Instrument

Information was collected during telephone interviews, with some questions sent to respondents in advance to facilitate data collection. In addition to collecting information about the size of the firm, the survey asked questions about the training and competence of new hires, the training and competence of present employees, future training requirements, utilization and quality of training programs, background information on the individual completing the survey on behalf of the firm, and additional information on the firm itself.

RESULTS

Description of Firms

Self-Assessment of Current Practices.

To determine how they viewed their competitive position, firms were asked to describe their current strategy regarding technology, employee skill levels, and compensation (Table 2). Sixty-three percent of the firms surveyed judged that they used moderately sophisticated technology. Most firms reported they required average skill levels for employees performing core work processes, and most firms considered their wages to be average or slightly above average. Based upon this self-assessment, a little over 25 percent of the firms considered themselves to be high-tech, high-skill businesses, but only four percent considered themselves to be high wage businesses. Modest linear relationships existed between wages paid and employee skill levels, technology level used, and employee skills and employee compensation. Because firms defined their own standards, these self-reported estimates may or may not conform to externally imposed definitions. For example, the Corporation for Enterprise Development ranked Kansas thirty-fifth in average annual pay. This suggests that Kansas firms actually pay relatively low wages, rather than average or slightly above average.

¹¹Urban counties (No. Firms=256): Johnson, Leavenworth, Miami, Wyandotte, Douglas, Shawnee, Butler, Harvey, Sedgwick. Mid-sized (No. Firms=143): Atchison, Barton, Cowley, Crawford, Ellis, Finney, Ford, Franklin, Geary, Labette, Lyon, McPherson, Montgomery, Reno, Riley, Saline, Seward. Rural (No. Firms=116): All other counties.

Types of Jobs Provided.

Kansas firms hired people for positions that required various types of skills. Figure 1 shows that the largest percentage of employees hired by Kansas firms were general labor/operatives, business/management personnel, skilled trades/crafts, clerical, and other. Positions requiring more advanced technical skills (e.g., engineers, chemical process/lab technicians, designer/draftsmen, computer support staff) were few in number. Based upon the number of employees filling each type of position, Kansas firms would not be characterized as employers seeking large numbers of persons with very advanced technical skills. A large percentage of the state's employees perform jobs which do not require advanced technical skills.

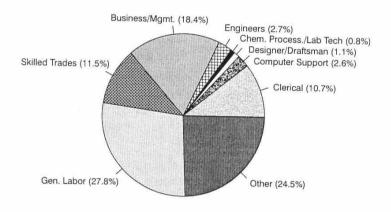

Table 3 shows the average percentage of employees performing various types of work by firm size. For small firms employing five to 49 persons, the largest percentage of their employees (34 percent) were skilled trades or crafts personnel. General labor/operatives comprised 19 percent of small firms' employees. Engineers, computer staff, designer/draftsmen, and chemical process/lab technicians accounted for very small percentages in small firms as well as in medium

¹²Kansas ranks forty fourth in number of Ph.D. scientists and engineers per 1,000 workers in the workforce, but seventh in number of science and engineering graduate students per one million population. The state produces graduates with advanced skills, but it does not employ them in the state. The number of Ph.D. scientists and engineers in the workforce is a measure of the potential pool of innovators in a state and the capacity for innovation. Source: *The 1996 Development Report Card for the States.* Washington, DC: The Corporation for Enterprise Development, 1996.

(50 to 250 employees) and large (251+ employees) firms. General labor/operatives formed larger percentages of employees in medium and large firms than in small firms. Small firms were the haven for skilled trades and crafts personnel while larger firms required larger numbers of general labor/operatives.

To summarize, while firms perceived that they were paying average to slightly above average wages, Kansas actually ranked fairly low when compared to national wage levels. In addition to paying wages that might not attract and retain the best workers, few Kansas firms described themselves as high-technology firms. Likewise, most jobs they offered did not require highly sophisticated technical skills. Thus, if wages are a measure of productivity and if a large pool of innovators (e.g., scientists and engineers) improves a state's ability to fuel industrial innovation and spawn new businesses, Kansas may not be positioned to compete in a business climate where survival is increasingly driven by the application of technology across a wide array of occupations. In addition, paying wages below national averages may limit the state's ability to retain highly skilled workers needed to improve the competitive position of the state's businesses.

Definitions:

Computer support staff = programming, data processing, etc.

Skilled trades/crafts personnel = machine operators, heavy equipment operators, mechanics/machinists, electronic, electrical technicians, etc.

Type of Skills and Education Required

According to Kansas employers, skill requirements for entry level jobs have changed. Compared to five years ago, entry level job skill requirements have increased slightly (Table 4, mean 2.98 where 3.0 on the scale was Increased Slightly). Forty-nine percent of firms surveyed reported a slight increase and 22 percent reported a significant increase, for a total of 71 percent describing some degree of increase. While entry level job skill requirements increased over the past five years, the skills of newly hired workers remained unchanged (Table 4, mean 2.23 where 2.0 on the scale was Remained Unchanged). Thirty-three percent said newly hired workers' skill level had not changed (despite an increase in skill requirements), an additional 23 percent said skills had decreased slightly (16 percent) or significantly (seven percent). While 43 percent said newly hired workers' skills had improved slightly (32 percent) or significantly (11 percent), these results alone do not confirm that worker skills matched job requirements. A gap between job requirements and worker skills at the entry level may still exist.

Most firms (57 percent) reported that their minimum educational and training standards for employment was a high school degree (Table 5), but 26 percent accepted workers with no high school degree. Only 17 percent of firms surveyed required some postsecondary education as a minimum standard for employment. The two largest categories of employees (see Figure 1 above) were general laborers (32.3 percent) and other (28.5%). General laborers probably do not need technical training, and the miscellaneous "other" category probably includes a mix of unskilled and skilled jobs. Even if both categories were assumed to require no special training or job skills, the remaining categories represented almost 40 percent of employees hired, and those categories would seem to require some training or special skills. These two sets of data suggest

that Kansas firms have jobs that required some training, but because from 30 to 60 percent of the jobs probably required no special skills, most firms do not have high expectations and set fairly minimal educational standards.

Job Requirements and Workers' Skills

Do Gaps Exist?

In 1989, and again in 1996, firms were asked to describe the gap between the qualifications of newly hired skilled workers and the needs of the businesses. On both occasions, more firms described a moderate gap (Figure 2). When asked how two other groups, newly hired skilled workers with vocational training and their current skilled workers (Figure 3) met the needs of the business, most firms felt there was only a slight gap. Clearly, two response patterns emerged. Newly hired skilled workers in 1989 and 1996 were not meeting employers' expectations (Table 6, first data column). Their skills did not match the needs of the business; a moderate gap existed. Newly hired skilled workers with vocational training and current workers more closely matched business needs, with only a slight gap between qualifications and job requirements (Table 6, center and right columns).

^{* 1989} data

Improvements Needed

In 1989, and again in 1996, businesses in Kansas perceived a gap between skilled workers' qualifications and job skill requirements, and they were quite explicit about what skills needed improvement (Table 7). In 1996, over half the firms identified 16 of the 22 areas or 73 percent of skills surveyed for improvement:

Basic Skills

- 1. Listening/oral communication
- 2. Writing
- Computation

Thinking Skills

- 4. Problem solving
- Decision making
- Comprehension/understanding
- 7. Creative thinking
- 8. Willingness to learn

Personal qualities

- 9. Work attitudes/work habits
- 10. Goal-setting/personal motivation
- 11. Organizational effectiveness/leadership
- 12. Teamwork
- 13. Interpersonal relations
- 14. Adaptability/flexibility

Technical skills

- 15. Computer
- 16. Business/management

In four areas, employers were more satisfied with employee skill levels in 1996 than in 1989. Skills showing significant improvement included reading, comprehension and understanding, goal-setting and personal motivation, and skilled trades. That was not the case for two other skills. Significantly more firms said employees' computer skills and comprehension and understanding skills needed improvement in 1996 than in 1989. In the case of computer skills and comprehension/understanding skills, the skills required increased more rapidly than employee skills.¹³ All other skills showed no significant change from 1989 to 1996.

¹³Despite the critical need for computer skills, the State has refused to adopt any strategy that would gain Internet Access for Kansas schools. Iowa, Nebraska, and Missouri have adopted strategies for school Internet Access.

What percentage of those hired by Kansas firms needed to improve skills and in what areas? In most skill areas, the percentage of those who needed to improve ranged from a mean of 28.73 percent for reading to 41.68 percent for goal setting and personal motivation skills (Table 8). Thus, according to their employers, almost one third of those hired needed some form of skill improvement.

While these results were sobering in that large numbers of firms cited the need for improvement of skills of large percentages of employees they hired, there were some encouraging signs. Improvement in reading skills was significant. The state K-12 educational system has focused upon reading, writing, and computation skills as part of its Quality Performance Accreditation system. Perhaps this improvement in employers' assessment of newly hired employees' reading skills is a result of many schools' efforts to improve teaching and outcomes in that area.

Key Findings

- More than half the firms set their minimal educational and training standards for employment at a high school degree, although 26 percent accept workers with no degree.
- Firms reported they used moderately sophisticated technology, required average skill levels of employees performing core work processes, and paid average or slightly above average wages. These self-evaluations reflect employer perception, not national or even regional realities. For example, Kansas ranks thirty-fifth in average annual pay. Kansas firms may be winning the local battle for employees, but may be loosing the war regionally and nationally as skilled employees seeking higher wages leave the state.
- One fourth of the firms considered themselves to be high-tech, high-skill businesses, but
 only four percent described themselves as high-wage firms. These firms are also at risk if
 they are not paying their high-skill employees competitive wages.
- Jobs that required average skill levels and paid average wages would not be described as high-wage/high-skill jobs, despite employer perceptions to the contrary.
- The largest number of jobs provided by firms surveyed were general labor/operatives, clerical, and business/management personnel, confirming that large numbers of high-wage, high-skill jobs do not exist.
- Skill levels required for entry level jobs increased slightly from 1989 to 1996.
- In 1996, as in 1989, a moderate gap existed between the qualifications of newly hired skilled workers and businesses' needs.

- A slight gap existed between newly hired skilled workers with vocational training and businesses' needs.
- A slight gap existed between current workers and businesses' needs.
- More than half of the firms reported their workers needed improvement in 16 of 22 skills (73 percent).¹⁴
- Skills showing significant improvement from 1989 to 1996 included reading, goal-setting/personal motivation, and skilled trades.
- Skills showing significant deterioration from 1989 to 1996 were computer skills and comprehension/understanding. Employee skill levels have not kept pace with increases in skill requirements.
- All other skill areas showed no change.
- In most skill areas, the percentage of employees who needed to improve ranged from a mean of 28.7 percent (reading) to 41.7 percent (goal-setting/personal motivation).

¹⁴Basic skills (listening/oral communication, writing, computation), thinking skills (problem solving, decision making, comprehension/understanding, creative thinking, willingness to learn), personal qualities (work attitudes/work habits, goal-setting/personal motivation, organizational effectiveness/leadership, teamwork, interpersonal relations, adaptability/flexibility), and technical skills (computer, business/management).

Training: Utilization and Evaluation of Training System

With the need for large numbers of employees to improve across a broad range of skills, the issue of training moves to center stage. A recent survey of Kansas workers revealed that more than 11 percent of the labor force are training to get a better job. ¹⁵ As reported in the previous section, employers estimated that as many as one third of their employees needed to improve their skills. Since a large percentage of the Kansas labor force has at least a high school diploma, lack of training may not be the primary issue. Rather, training outcomes or what a diploma or advanced degree guarantees becomes the critical issue.

High school Training

While most firms required a minimum of a high school diploma of their employees, employers were not overly enthusiastic about the readiness of high school graduates to join the labor force. Nearly 180 firms, or one third of those responding, said high school graduates were poorly or inadequately prepared, while less than 100 felt they were more than adequately or well prepared (Figure 4, far left and far right sections of the scale or graph). The remaining 307 firms described high school graduates as adequately prepared (Figure 3, center section). The overall picture was not one of overwhelming enthusiasm for these workers' skills. Table 9 shows employers gave high school graduates' productive value a mean score of 2.77 (inadequately prepared), which would be a C- on a five-point scale (A = 5, C = 3, F = 1).

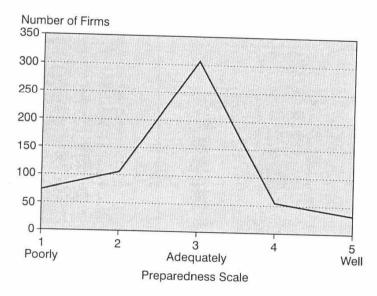

Post-Secondary

Although most firms report that a high school education is the minimum education level considered when hiring, a sizable number of firms reported intentionally employing people who had received technical or vocational training at the post-secondary level. Table 10 shows that a large percentage of firms intentionally hired employees who had trained in technical or vocational areas at local community colleges, area vocational technical schools, and state universities. In addition, when asked to rate their satisfaction on a five-point scale, these firms reported they were satisfied (mean approximately 3.0) with the technical and vocational skills of those employees.

Employers also report using technical or vocational training programs to upgrade employee skills (Table 11). Over half the firms used technical/vocational training in the last five years. Similar levels were reported in 1989. Firms were most likely to send employees to professional association seminars for training (Table 12). Other sources used by over half the firms who trained employees included community colleges and consultants or other commercial trainers. Not all firms used community colleges equally. Analysis of use of training programs by firm size (Table 13) revealed that small firms relied very heavily upon professional association seminars for training and utilized community colleges and consultants/commercial trainers less than medium and large firms.

¹⁵Glass, Robert H., Krider, Charles, E., & Nelson, Kevin. "The Effective Labor Force in Kansas: Employment, Unemployment, and Underemployment," Kansas Business Review, 1996 (Vol. 20, No. 1), p. 9 - 19.

^{**}Chi Square $p \le .01$

In 1996, as in 1989, firms were more likely to learn about the training from vendors, advertising, the training institution, or a business associate (Table 14). Vendors provide information to a large percentage of firms, regardless of their size (Table 15). Differences based upon firm size existed in other areas. For example, more large- and medium-sized firms learned about training from training institutions and local officials than did small firms. Compared to large firms, small- and medium-sized firms were more likely to learn about training opportunities through advertising from professional associations or commercial trainers.

Employers were asked if the training they used was customized (designed or adapted to meet their special needs. Training provided by consultants and commercial trainers, and union apprenticeship training was more likely to be customized than training obtained from other sources (Table 16). Table 17 shows that most firms had never been approached by community colleges or AVTSs about customized training.

The quality of the training provided by all sources was adequate (Table 18). That provided by state universities, private colleges/universities, professional associations, consultants or commercial trainers, community colleges and AVTSs was judged to be adequate to good (mean 3.50 to 3.79) by those using those sources of training.

All firms were asked to rate the vocational technical training system in Kansas on a four-point scale, where one was very poor and four was good (Table 19). The system received adequate to good ratings in all areas: geographical accessibility, program and course content, instructors, equipment used, and scheduling convenience. Firms felt that equipment used by training institutions must be technically advanced. Eighty percent responded that it was important or very important for community colleges and AVTSs to have the most technically advanced equipment, an opinion that has not changed since 1989 (Table 20). In contrast to the state's current funding strategy for training equipment, employers want students to be trained on the most technically advanced equipment. The current strategy assumes that students can learn "concepts" on obsolete equipment and then learn to use state-of-the-art equipment at the employer's expense (on-the-job training). That added cost affects Kansas firms' competitive position. This is a further symptom of how the state's employers and employees lose competitive advantage due the state's failure to invest in training equipment. At some point, the question must change from "How do we scrape by?" using low tech equipment and unskilled workers to "How do we move forward?" toward a more technically advanced and competitive new economy.

Barriers to Training

Businesses stated that employee skill levels needed to improve, that the vocational and technical training system was accessible, but 47 percent of firms surveyed had not used technical and vocational training for employees in the past five years. Small firms were less likely to utilize training programs (Table 21). Those who had not utilized employee training were asked to identify reasons for not utilizing training programs to upgrade employee skills. Only 20 percent stated their employees had not needed training, down from levels reported in 1989 (Table 22). The most frequently cited reasons for not using technical and vocational training programs were the use of on-the-job and in-house training programs.

The cost of employee training was usually borne by the firms themselves. Seventy-six percent said the firms paid for all of the training, six percent paid using public resources, and 27 percent paid with a combination of firm and public resources (Table 23). The amount spent on training was about five percent of their total payroll.

Key Findings

- High school graduates' ability to add productive value to firms was less than adequate.
- Businesses gave the state's K-12 system a C- for their ability to provide students who
 added productive value to the firms who hired them.
- Firms were satisfied with the technical and vocational skills of employees who trained at local community colleges, area vocational technical schools, and state universities.

- In the last five years, approximately half the firms (53 percent) used technical/vocational training programs to upgrade employee skills.
- The quality of training received from all providers was adequate.
- The state's vocational and training system was adequate to good in geographic accessibility, program and course content, instructors, equipment used, and scheduling convenience.
- While equipment used by the state's vocational and training system was described as
 adequate rather than good, employers insisted that equipment used by training institutions
 needed to be technically advanced to meet firms' training needs.
- Small firms were less likely than large- and medium-sized firms to utilize technical and vocational training programs.
- Firms of all sizes who did not use technical and vocational training programs did not do so because they used on-the-job or in-house training programs.
- Seventy-six percent of all firms paid for all of the training they provided. The amount spent was about five percent of their total payroll.

Implications for Future

Availability of Workers

Firms reported that it was moderately difficult to find skilled employees (Table 24). On a four point scale (1 = extremely difficult; 4 = rather easy), responses were fairly evenly distributed, with 29 percent reporting moderate difficulty finding skilled employees today. Compared to two or three years ago, 23 percent said it was much more difficult to find skilled employees today, 32 percent said it was slightly more difficult, and 36 percent said it was slightly less difficult. Firms predicted the tight labor market would continue. When asked how difficult it would be to hire full-time skilled employees two or three years from now, more firms predicted it would be slightly more difficult.

| 2-3 years from now | 26% | 31% | 33% | 10% | 2.28/2.0 (0.96) |

Skilled employees were more difficult to find today in urban than in rural areas. ¹⁶ For example, firms located in rural counties (Figure 5, far left section, black bar) said skilled workers were somewhat difficult to moderately difficult to find, resulting in a mean of 2.69. Firms located in urban counties (white bar) described a tighter labor market (or were looking for workers with higher or different skills). More urban firms said it was moderately difficult to extremely difficult to find skilled employees (mean of 2.34). ¹⁷

Compared to two or three years ago (Figure 5, center section), firms in rural and mid-sized counties were fairly evenly divided between thinking it was slightly more or slightly less difficult (mean = 2.48 and 2.41). Firms in urban counties thought it was slightly more difficult (mean = 2.15). When asked to predict availability of skilled workers two to three years from now, there was no significant difference between responses of firms in urban, mid-sized, and rural counties (Figure 5, far right section). Urban and mid-sized counties predicted skilled workers would be more difficult to

find (mean: urban = 2.23; mid-sized = 2.31) and rural counties were more evenly divided between predicting slightly more and slightly less difficulty (mean = 2.43).

Figure 5
Availability of Skilled Employees by Firm Setting

Seventy-eight percent of the firms surveyed would be willing to pay higher wages to attract workers who had the fundamental background necessary to quickly learn and competently do their job (Table 25). When asked how great a percentage increase over current wages they would be willing to pay, the median was 10 percent (mean = 14.4 percent; std. dev. = 10.39).

Skills Workers Will Need

Employers predicted that, over the next two to three years, technology changes in their industry and their firm would increase, to a moderate degree, the level of technical or vocational skills needed by their employees. Figure 6 shows that, in 1996, employers expected employee skill requirements to increase to a moderate degree (median = 3.0; mean = 2.83; std. dev. = .869). The larger the firm, the greater the anticipated demand for improved employee skills (Table 26). Small firms said skill requirements would increase to a small or moderate degree, while medium and large firms expected skill requirements to increase to a moderate degree. Non-manufacturing firms expected technology to impact their employees more than manufacturers. Firms located in mid-sized and urban counties predicted skill requirements would increase more than did firms located in rural counties.

Figure 6
Impact of Technology on Employee Skill
Requirements in Two to Three Years

Skills that employers predicted their present employees would need to improve included most of the basic skills, all types of thinking skills, and all types of personal qualities from work habits to interpersonal relations (Table 27). The technical skill most likely to need improvement was computer skills. Several skills showed improvements over 1989 estimates. Fewer employers were concerned about the impact of technology upon employee adaptability/flexibility, business/management skills, and machine operation skills in 1996. However, over 30 percent of the firms expressed concern about the impact of technology upon all skills, indicating they expect technology to place demands upon all types of skills. In addition to the large percentage of firms expressing concern about all skills, the percentage of employees who will need to improve skills as a result of technological change over the next few years was quite high (Table 28), ranging from a low of approximately 30 percent to a high of 45 percent of all employees.

The bottom line was that large percentages of employees not only needed to improve skills now (presented earlier in Table 8), but the pressure to upgrade skills will not subside. Technological changes will increase skill demands upon employees whose skills already lag behind job requirements. Given the degree of criticism, are employers concerned about having access to retraining programs through community colleges or area vocational technical schools? Not necessarily. When asked how important access would be over the next three years, employers described access to retraining

through community colleges or area vocational technical schools to be of minor importance. This apparent disagreement between employers' description of the need to improve employee skill levels now and over the next two to three years and the need for access to retraining programs through community colleges reflects the tendency to do no training, do on-the-job training, use professional association seminars, or to turn to consultants or other commercial trainers.

Key Findings

- Employers reported moderate difficulty finding skilled workers today.
- Compared to two or three years ago, finding skilled workers today was slightly more difficult.
- In two or three years, finding skilled workers will be slightly more difficult.
- Employers in urban counties reported more difficulty finding skilled employees than did employers in rural counties, and that trend was predicted to continue in the future.
- Employers (78 percent or 446 firms) would be willing to pay higher wages (up to 10 percent more) for workers with higher skills.
- Over the next two or three years, technological advances will increase, to a moderate degree, the job skills employees will need.
- Small firms and firms in rural counties predicted less impact by technology upon employee skills.
- Technology was expected to place demands upon all types of skills for a large percentage of employees.

SUMMARY

Have employers' assessment of the Kansas workforce changed from 1989 to 1996? Not much. In 1989, employers reported a gap between newly hired workers' skills and job requirements. Only two of the top ten skills needing improvement were basic academic skills--listening/oral communication skills and writing skills. The remaining eight were "higher order" skills, such as goal setting/personal motivation, work attitudes and habits, organizational/leadership skills, problem solving, etc. Much the same picture emerged in 1996. The only basic skill among 1996's top ten problem areas was listening/oral communication, and the other nine were all higher order skills. That did not mean that basic skills were of no concern to employers. Over 50 percent of all employers reported that writing and computation skills needed improvement. While reading, goal-setting/personal motivation, and skilled trades improved significantly from 1989 to 1996, computer skills and comprehension/understanding skills showed significant deterioration. All other skill areas showed no change, continuing to be areas of concern.

What does this mean in terms of the state's competitive position? Are workers poorly prepared to add productive value to the firms that hire them or were employers' expectations unreasonable? Employers reported high school graduates were not always adequately prepared to add productive value to their firm. Was that because employers set impossibly high standards? Probably not. Most firms reported they required average skill levels and paid average wages. Kansas firms did not seem to have exceptionally high expectations or set exceptionally high standards because they were not trying to fill large numbers of high-skill, high-wage jobs which required highly-skilled workers. In fact, the largest percentage of workers in the state had jobs which probably required very little technical training (e.g, general laborers). However, Kansas firms were not frozen in time or unaffected by the national and global competition. Skill requirements for their entry level jobs increased from 1989 to 1996. A moderate gap continued to exist between the qualifications of newly hired skilled workers and job skill requirements. And a slight gap existed between current workers' skills and the firms' needs. Firms predicted that technological advances would increase the technical skills needed by employees.

In Kansas, workers' skills have not kept pace with job skill requirements. Firms have difficulty finding skilled workers, especially firms located in urban counties. All employers expect the situation to become more difficult in the near future, and would consider paying higher wages, up to 10 percent more, to workers with higher skills. If employer expectations are not unreasonable and worker skills are deficient, the state's businesses are in a poor position to survive or prosper in increasingly competitive national and global markets. What should be done to improve workers' skills? Firms were satisfied with the technical and vocational skills of employees trained at local community colleges, area vocational technical schools, and state universities. High school students and their parents should take note of this and plan to seek some form of post-secondary training. The K-12 educational system should also take note and prepare **all** students for some form of post-secondary training.

To prepare students to seek some form of post-secondary training and prepare for the continuous skill upgrading that technological change will place upon them, parents, students, and educators at all levels should expect and demand high performance. Students must demonstrate competency and not expect to graduate simply because of time spent in the school system. Parents and students must understand that education is an interactive process. Educators are not solely responsible for guaranteeing that students become competent in various skills. Learning can not occur without commitment from parents and students. Parents and educators must demand that students develop skills that will enable them to become productive contributors. Those skills include not only basic academic skills (e.g., reading, writing, computation, etc.), but other "higher" order thinking skills as well (e.g., problem solving, creative thinking, comprehension/understanding, etc.). Students must also exhibit a good work ethic at school. Parents and educators must demand good work attitudes and work habits, and help students learn to set goals, be adaptable, and work well in teams so those skills will follow them into the workplace.

Businesses should not be left out of the education process. While firms must invest in their current employees and provide support for training to upgrade skills of those adults, businesses must

also communicate and demonstrate to parents, students, and educators what skills are needed in the workplace. School-to-work programs and apprenticeship programs are obvious examples of ways business can ensure that qualified workers are available. The business community should also support efforts to measure student performance and help the education system move toward outcome-based education where students do not advance until competency (defined at sufficiently high levels) is demonstrated. Businesses are in a unique position to share what they have learned about quality control and employee assessment with educators. Using what they know about problem solving and teamwork, business professionals should be working with teachers to analyze why the quality of the product produced by the K-12 educational system (i.e., the student) does not meet the needs of the client (i.e., employers). If such discussions occurred frequently and continuously, educators would have the community support needed to educate students while dealing with some of the state's and nation's most difficult social issues. Businesses must communicate their needs to educators and then help develop an educational system and curriculum that prepares students to add productive value. Only then will parents, students, and educators be able to provide employers with what they need-workers who add productive value to their firms.

IMPLICATIONS

That workers' skills do not meet job skill requirements was the overriding finding of this report. The pace of change, driven by technological advances and changes in how work was organized, continued to outstrip the rate at which workers' skills improved. Educators, employers, and employees have been and will continue to chase a moving target. This has serious implications for Kansas and requires a serious, committed response at all levels of private and public activity.

1. Development of a highly skilled workforce must continue to be a strategic objective for Kansas economic development.

The workforce is a state strength, but it is also a weakness. Kansas does not have a large reservoir of unemployed or underemployed skilled workers. In fact, regional shortages of skilled workers exist. Similar shortages exist nationwide, so the state cannot solve labor shortages or skill deficits by importing labor from other states. Ways must be found to better utilize the existing population. Skills must be improved through training and retraining and those not currently in the work force must be encouraged to enter or re-enter the labor market. Employers must commit resources to train and retrain their current employees, both in basic academic skills and technical skills.

The state's education and training system must have the institutional capability to provide training for workers to upgrade existing and develop new skills as job skill requirements change. Institutions must have the capability to meet the workforce's training needs, from the production

¹⁹See the 1996 Kansas Strategic Plan, Kansas, Inc., for a thorough discussion of a broad range of workforce issues.

worker who needs to improve communication and math skills to the computer programmer or engineer who needs to keep abreast of cutting edge technology. The state must have a quality educational system that includes K-12, technical training and associate degree programs, baccalaureate programs, and post-graduate programs to produce and maintain the quality workforce needed by Kansas businesses which must do business in the new, competitive, global economy. Post-secondary institutions, especially community colleges, must encourage employers and employees to access training to improve basic academic skills and technical skills by providing classes that meet the needs of nontraditional students and customized training that meets the needs of businesses. Educators and government officials must focus upon removing barriers created by a fragmented training system.²⁰ Duplication of training within the training system must be reduced so savings that result can be used to provide advanced equipment for training programs.

Current workforce problems will require both private and public action to solve existing and future challenges, but that can happen because Kansas has a history of solving problems through private-public cooperation. Employers, workers, parents of students, students, educators, and government officials at the community as well as the state level must understand that their prosperity depends upon their commitment to developing a skilled workforce. Employers must commit resources to train and retrain their current employees, both in basic academic skills and technical skills. Students, supported by parents and educators, must develop good work attitudes and habits in school and transfer those skills to the workplace. Students, and their parents, must also realize that post-secondary training is essential and life long learning will be necessary to develop new and upgrade existing technical skills. While college education is not required for all, some form of technical/vocational training in apprenticeship programs or at community colleges and AVTSs is required.

2. Educators, supported by parents and employers, must provide business and industry with workers who add productive value to the firms which employ them.

Educators, supported by parents and employers, must continue to improve curriculum, focus on educational outcomes, and demand high standards for high school graduation. The K-12 education system should continue to focus upon improving the skills of its students. Business needs students to develop competency in basic skills (e.g., reading, writing, computation, communication), thinking skills (e.g., problem solving, decision making, etc.), and personal qualities (e.g., work habits, teamwork, etc.). Schools should continue to focus upon outcome measures and make certain high standards are set. Students seeking a high school diploma must meet high performance standards and demonstrate competency in a set of basic skills, thinking skills, and personal work habits. The curriculum must not be too loose and undemanding or the **average** student will not be prepared to meet the increasingly sophisticated needs of business and industry. The K-12 system must prepare

²⁰Krider, C.E., Redwood, A.L., & Stella, M.E. *Kansas Workforce Employment and Training Programs: Do They Function as a System?* Institute for Public Policy and Business Research, University of Kansas, 1994.

non-college bound students for post-secondary technical training and associate degree programs as well as it prepares students who seek admission to four-year baccalaureate programs.

3. Business and industry needs to communicate job skill requirements to educators on a continuous basis.

Business must communicate to educators what job skills are required. While donating funds or items to support academic and extracurricular activities is important, the role of business could evolve toward providing more frequent and effective support and feedback to teachers and educators. Educators need to know more about the quality of the product they produce (i.e., the students). Is the client (i.e., the employer) happy with the quality of the product or (if it were like other products) would it be returned for repairs or replacement? How well prepared are **average** students to enter the workplace? Are they prepared to go to work, or are they entering the work world lost and unprepared.

Schools get frequent and useful feedback about the performance of their college-bound students through college entrance exam scores and college placement rates. Similar feedback is not available for non-college bound students. Educators and the business community in each school district should consider what this lack of feedback is costing the community. Are businesses less competitive due to poorly trained workers? If businesses become less competitive and fail, what is the loss to the school district in terms of lost revenue? When these costs are examined, perhaps both educators and businesses will realize effective, working partnerships which provide feedback and improve training are a good investment. Information exchange should focus upon how the nature of work is changing -- what impact technology or new management practices have on job skill requirements.

4. The business community and the education system must commit to developing effective business-education partnerships.

Business-education partnerships should be created and strengthened in every community in Kansas. What is an effective working partnership? Each community must decide what works. However, several elements should be considered. The partnerships must evolve so the K-12 education system does not continue to produce graduates who add little productive value to the firms which employ them. Business-education partnerships must focus upon developing technical preparation programs and school-to-work programs that produce students who are ready to enter the labor market with skills needed by employers. This will require the business community to become more familiar with current educational practices and teachers to become more familiar with the workplace. Are teachers familiar with and comfortable in non-educational work settings? Can teachers participate in summer programs, internships, or sabbatical programs in business and industry that prepare them to train students for high-skill, high-wage jobs? Do teachers (and their students) have access to hands-on experiences in business and industrial settings? Do teachers get credit (in

terms of promotion, salary, etc.) for such training in the same way that they get credit for attending education classes at colleges and universities? Are there communities in this state and in neighboring states where business-education partnerships are providing this type of information exchange and teacher support? Other communities may find it useful to examine how those partnerships evolved so they can begin to develop effective partnerships in their own communities.

5. Inform students and parents of post-secondary training options.

Parents and students must realize that some form of post-secondary education or training is essential and that many options are available. For students who do not wish to enter a four-year degree program, other options must be available and well publicized. Guidance counselors must be prepared to help these students and their parents learn about school-to-work programs, apprenticeship programs, two-year associate degree programs, and technical training programs. Students must have available to them a coordinated system which provides quality training and allows credit for training in one part of the system (e.g., community college) to count in another part of the system (e.g., university) as their training goals change. As clients of the education system, students should be assured that the system will be flexible enough to recognize skills developed on the job and not require training or course work in areas where competency already exists.

6. Create tech prep programs, school-to-work programs, and apprenticeship programs that are academically sound and linked to the business world.²¹

Businesses and industries in desperate need of more qualified workers and unhappy with new recruits from the state's secondary schools must support and invest in training high school students through apprenticeship programs and other programs that link school to jobs. Teachers and employers must work together to develop courses that develop necessary skills and demand high performance levels. Working together, employers and teachers can share information and solve problems regarding curriculum (i.e., what skills need to be trained), performance evaluation (i.e., student grades), quality issues (i.e., how to improve low grades or unacceptable performance). Involvement at the level of the teacher, not just at the level of the administrator (e.g., principal or state curriculum planning committees), may benefit all. Businesses communicate their needs directly, teachers get support, and students are given a reason to learn by making their academic courses relevant to their lives and focused upon the need for quality performance.

The state has been moving too slowly in this area. Lack of or weak tech prep programs contribute to the serious gap between job skill requirements and the skills of the young worker. Every school district should have a serious, high-quality tech prep program by the year 2000. Tech

²¹Programs should focus upon training skills that result in employment in jobs that pay a living wage. Sending students to work making hamburgers at a fast food restaurant does not prepare the student to earn a living wage and should not be approved as a school-to-work program.

prep programs are not old vo-tech programs with new names. Serious, high-quality tech programs should be linked to two-year technical training or associate degree programs so students receive the post-secondary technical training that current and future jobs require.

7. Support Adult Basic Education (ABE) to enable those who have already left the education system improve their basic skills.

Many workers or potential workers in Kansas have basic skills (reading, math, writing, communication) which are under- or undeveloped. These people may have graduated many years ago, may have completed high school last year, may have dropped out of high school, or may be entering the job market because of welfare reform. ABE programs need to be a higher priority in Kansas. Instead of asking what is the least amount of state dollars needed to receive Federal support for these programs, the state needs to adopt a more strategic view and invest at levels that address the need for ABE created by older workers as well as welfare reform and school drop outs. Currently ABE programs focus upon those preparing to take GED tests. Resources barely meet those needs, so programs have difficulty serving those who need to upgrade basic skills but do not need a GED.²² With adequate funding, ABE programs provide support for those seeking to improve basic skills.

CONCLUSION

The state must continue to invest in education and training at all levels as a strategy for improving its human capital and hence its competitive position. Kansans must realize that, to avoid becoming a "Third World" state with low-paying jobs, Kansas must shift--and shift rapidly--to "knowledge" work. Knowledge work requires skilled workers, not just workers who hold high school diplomas. Diplomas seem not to be the answer for Kansas. The state ranks high in number of workers who have high school diplomas, but employers complain about the lack of skills. Fundamental, systemic changes may be necessary to produce workers who can perform knowledge work and escape from low paying, general labor jobs. Community, regional, and state leaders must focus upon utilizing limited education and training resources at all levels to improve service delivery. The state's leaders must take the lead in articulating the strategic importance of education in preparing the Kansas workforce for the twenty-first century. Kansas' competitive advantage will be its workforce.
