Report No. 45

Charles E. Krider

Co-Director, Kansas Center for Community Economic Development Director, Institute for Public Policy and Business Research

Foreword

The Kansas Center for Community Economic Development (KCCED) is a joint center of the Institute for Public Policy and Business Research at the University of Kansas and the Kansas Center for Rural Initiatives at Kansas State University. Its purpose is to enhance economic development efforts by bringing university expertise to rural Kansas.

KCCED is funded by a grant from the Economic Development Administration of the U.S. Department of Commerce. The statements, findings, and conclusions of this report are those of the authors and do not necessarily reflect the views of the U.S. Government, the University of Kansas, or any other individual or organization.

Economic Trends: Leavenworth County

Introduction

The use of data in economic development is important because it assists a community in "taking stock" and understanding its current situation across several different areas of economic and demographic performance. However, data alone do not lead to a well-founded understanding of the community. Data must be analyzed and interpreted, taking into account the intuition of those within the community about what the overall trends really mean. In other words, data serve as the foundation for an analysis which concludes: 1) what is happening in the community relative to other regions over time, and 2) what potential impacts or consequences can be inferred from the data.

This report looks at variables categorized under the following areas:

- population
- employment
- earnings and income
- retail trade
- agriculture
- education

Throughout the report, Leavenworth County's performance is compared with the performance of the State of Kansas and with Surrounding Counties¹. It is by no means a comprehensive analysis of economic trends facing Leavenworth County but rather an overview of some key economic and demographic variables.

¹ "Surrounding Counties" are Atchison, Jefferson, Douglas, Johnson, and Wyandotte Counties.

POPULATION

Population size and economic activity are closely related. Changes in population size are directly linked to employment opportunities, wage differentials between regions, and a community's overall economic conditions and quality of life. Communities with growing populations are generally regarded as being more able to adapt to a changing economic environment due to the opportunities presented by new residents as additional consumers, taxpayers, and suppliers of labor. Without population growth, communities face problems of a tightening labor market, lack of new customers for businesses, a shrinking tax base, and an overall decline in economic activity. Generally, areas of population growth are also areas of economic growth, whereas areas of population loss suffered previous economic decline and restructuring.

Population characteristics are regarded as indicators of a region's economic conditions and economic potential. The level of Leavenworth County's population relative to the state's population reflects the county's overall level of competitiveness with respect to other regions within the state. A minimum population is necessary to sustain a basic level of public and private services and facilities. Past and projected population change is indicative of community economic trends and can be compared to other counties and the statewide and national averages.

Migration is linked to job opportunities and demand as well as wage differentials between regions. Counties with low rates of job creation and low wages will face higher worker mobility due to a "push" factor (lack of opportunity) or a "pull" phenomenon by urban areas with higher wages, better job opportunities, and a perceived better quality of life. Other determinants of regional migration are age and education. Generally, there is a life-cycle pattern to migration with the population aged 18 to 45 being the most mobile age group. The effect of education on migration is reflected by the movement of well-educated workers toward better job matches for themselves and their spouses and their attempts to raise their income levels by migrating to areas with employment opportunities.

Population: Key Findings

- During the 1980s, Leavenworth County's population grew 17.4 percent, which was more than three times as fast as the growth rate of Kansas and twice the rate of the U.S. During 1990-1997, the county's population grew 9 percent compared with 4.7 percent of Kansas and 7.6 percent for the U.S. (Table 1).
- In the 1990s, the county's annual growth rates were greater than the state's rates in 1991, 1993, 1995 and 1996. During 1991, the county's rate of growth was four times greater than the State's rate (Table 1).
- During the 1970s, Leavenworth County's population growth rate was less than Kansas' and the U.S'. In the 1980s, the county's population growth rate was three times the State's and

- about twice the U.S.' During 1990-1997, Leavenworth County's rate was again twice the Kansas rate (Table 2 and Figure 1).
- Since 1980, Johnson County had the highest growth rate for the neighboring metropolitan counties in Kansas with a 31.4 percent increase from 1980 to 1990 and a 17.6 percent increase from 1990 to 1997. These rates were higher than Leavenworth County's rates during the both periods (Table 2 and Figure 1a).
- In the decades ending 1970 and 1990, Leavenworth County's net migration was positive
 while the state's net migration was negative. During the period 1990-1997, Leavenworth
 County's net migration was over 7 times the state's net migration (Table 3).
- Leavenworth County maintained its rank as seventh most populated county in Kansas in 1940 and in 1990. Leavenworth County is projected to become sixth most populated state in 2020 (Table 4).
- Leavenworth County was the fourth fastest growing county in Kansas from 1980 to 1990 behind Finney, Johnson, and Douglas counties (Map 1). During 1990-1997, it was tenth in population growth in Kansas (Map 1a). The 10.5 percent net migration from 1980 to 1990 for Leavenworth County was the fourth highest for Kansas. Johnson County had the highest net migration at 20.3 percent followed by Finney County at 15 percent and Douglas at 11.9 percent (Map 2).

EMPLOYMENT

Employment levels are an important measure of a community's economic vitality. The size of the labor force shows the number of people who are either working or willing to work. The size of the labor force is influenced not only by population but also by the perceptions of individuals that suitable job opportunities exist. Diverse, healthy economies tend to offer the widest variety of job opportunities and thereby attract a large number of job-seekers, which increases the size of the labor force. The level of unemployment reflects the amount of economic activity within an area and how well the local market is able to match the supply and demand for labor. Job creation rates (net change in average annual employment) reflect the growth in employment levels and the range of employment opportunities. As some jobs are lost in a community due to changing economic circumstances, they may be replaced by new jobs. Net job creation reflects the net gain or net loss in jobs over a given period of time.

Employment: Key Findings

- The average annual employment (by place of work) for Leavenworth County has shown good growth in the last 10 years with a 13.2 percent increase from 1986 to 1991 and 9.8 percent increase from 1991 to 1996 (Table 5). During 1986-1991, the average annual employment growth for Leavenworth County was 44 percent higher than both the state and national growth rates. Employment growth has tapered a little during 1991-1996 but still slightly above Kansas and U.S. growth rates (Table 5 and Figure 2).
- During 1986-1991 and 1991-1996, Leavenworth County's employment growth rate was lower than that for Johnson and Douglas counties but higher than for Atchison and Wyandotte counties. Leavenworth County's employment growth rate was higher than for Jefferson County during 1986-1991 but lower than for Jefferson County in 1991-1996 (Table 5 and Figure 2a).
- The number of firms located in Leavenworth County has increased 23.7 percent from 1986 to 1996, compared to an 10.8 percent increase for Kansas (Table 6).
- For Leavenworth County, the number of firms employing 20 to 99 workers grew at a faster rate than those with less than 19 workers and those with 100 to 499 workers (Table 6). For Leavenworth County, around 88.3 percent of the firms employ fewer than 19 workers in 1996 compared with 87 percent for the State (Table 7). The importance of small firms to the economy indicates a need for strategies that nurture new business development and assist existing small businesses.
- Total employment for Leavenworth County grew from 29,222 in 1991 to 32,098 in 1996, for a growth rate of 9.8 percent, compared with 9.1 percent for Kansas during the same period (Table 8). Farm employment for the same time period declined by 5.4 percent in both Leavenworth County and the State. Leavenworth County's decline in Mining (negative 24.8 percent) is much worse than the 18.6 percent decrease in Mining jobs in Kansas.

- Traditionally, Leavenworth County's economy has been dependent upon government employment due to the presence of Fort Leavenworth. Although Government and Government Services grew just 1.2 percent during 1991-1996, the sector remains the top employer (12,233) in 1996. The Services sector follows as next top employer in Leavenworth with 7,596 employed (Table 8).
- The largest nominal increase in employment from 1991 to 1996 for Leavenworth County
 occurred in the Services sector with an increase of 1,179 persons employed. The next two
 largest nominal employment gainers were Retail Trade and Construction, with increases of
 508 and 439 jobs, respectively. (Table 8).
- The Agricultural Services sector and the Manufacturing sector in Leavenworth County offered the largest percent growth in jobs in Leavenworth County from 1991 to 1996 (Table 8 and Figure 3).
- In 1996, Leavenworth County's Government and Government Services sector had the largest share (38.1 percent) of total employment, while Services and Retail Trade were 23.7 and 13.4 percent of total employment, respectively (Table 8a).
- The labor force participation rate is the percentage of population 16 years old and over that is in the labor force. The labor force participation rate in 1990 for Leavenworth County was 60.5 percent (Map 3). This participation rate was less than Kansas' rate of 65.4 percent and the U.S. rate of 64.4 percent (1990 U.S. Census). Leavenworth County had the lowest participation rate of its surrounding counties.
- The 1997 unemployment rate for Leavenworth County was 4.4 percent, which, although among the lower rates in the region, was higher than Kansas average unemployment rate of 3.8 percent (Map 4).
- Change in employment (place of residence) from 1990 to 1997 for Leavenworth County was 11.7 percent. This employment data is based on an individual's place of residence, unlike other data which have been based on place of work. Leavenworth County's employment data indicate that job opportunities have increased for residents of Leavenworth County both in and out of the county (Map 5).

Earnings and Income

Earnings and income are the sources of revenue for the community residents. Higher average wages may indicate a greater number of jobs in high growth, high performance businesses. Low wage growth may indicate a higher concentration of stable, declining industries. Per capita personal income indicates the relative wealth of the area compared to the state. As the productivity of business and industry increases, personal per capita income also rises. Decreasing or stable rates may be the result of mature or declining industry. The following section contains data on the average wage per job and per capita personal income.

Earnings and Income: Key Findings

- The average wage per job for Leavenworth County (\$27,872 in 1996) was \$3,779 higher than the state average and \$611 lower than the national average (Table 9, Figure 4).
- In 1986, 1991, and 1996, Leavenworth County's average wage was consistently lower than for Johnson and Wyandotte counties but higher than for Atchison, Jefferson, and Douglas counties (Table 9, Figure 4a).
- Per capita personal income for Leavenworth County lags behind the state's figures.
 Leavenworth County's per capita personal income in 1996 was \$18,377, while Kansas' per capita personal income was \$23,133 (Table 10 and Figure 4b).
- Per capita personal income for Leavenworth County is higher than for Wyandotte County but lower than for Atchison, Jefferson, Douglas, and Johnson counties (Map 6).

RETAIL

Retail trade is part of a community's business environment, which is affected by several things. Past decisions by investors, business managers, taxpayers, and policy makers each contribute to share a climate which either promotes or inhibits the productivity of local businesses and therefore affects decisions about growth and expansion. Other contribution factors include the level of competition, the availability of suppliers and supporting industries, the cost of labor, and taxation and regulation within the community. Some types of establishments will thrive in an environment in which other firms cannot operate profitably.

The level of taxable retail sales is an indicator of retail sector performance and the overall strength of the local consumer market. The County Trade Pull Factor (CTPF) accounts for the relative retail trade performance of each county in terms of the average retail trade activities of Kansas. CTPF is calculated by dividing the county's per capita sales tax collections by Kansas' per capita sales tax collections. A CTPF value of less than 1.00 indicates that the county is losing customers due to "out-shopping" by residents. A CTPF of more than 1.00 would indicate that the county is attracting retail customers.

Retail: Key Findings

- Taxable Retail sales in Leavenworth County have grown at a rate faster than the state's rate in 1991, 1993, and 1997 (Table 11 and Figure 5).
- The trade pull factor for Leavenworth County for 1997 was 0.47, which indicates that it lost retail trade to surrounding counties. Douglas and Johnson Counties with CTPFs of 1.01 and 1.48, respectively, out-performed Leavenworth County and most surrounding counties in attracting customers (Map 7).

AGRICULTURE

The data on agriculture will help determine whether or not the overall importance of this sector in the county has been increasing or decreasing and how this compares with other counties and the state as a whole. The economic well being of Leavenworth County in the past was not dependent on the strength of this industry sector, but it is interesting to look at the level of activity in agriculture and how the character of this industry is changing in the county. The agriculture section contains tables and figures on the total value of field crops and the total value of livestock and poultry.

Agriculture: Key Findings

- The total value of field crops for Leavenworth County increased an average of 33.3 percent between 1993 and 1996. The state totals, on the other hand, have increased an average of 16.9 percent during the same period (Table 12).
- The value of livestock and poultry is on a general downward trend, declining an average of 11.8 percent from 18.3 million in 1993 to 15.9 million in 1996 (Table 13).

EDUCATION

Education is another key to a strong community. Residents who have a strong educational background will be more employable and able to command higher salaries. Employers will benefit as well because they will most likely experience lower turnover and training costs. Individuals with lower education levels have a harder time finding jobs that can supply a living wage and may be more likely to use social services, such as food stamps.

Education: Key Findings

- In general, the education level of the county's population was slightly better than the State's in 1990 (Table 14).
- Leavenworth County has a higher percentage of its over-25 population with a graduate degree than the state, with 11 percent for Leavenworth and 7 percent for Kansas (Table 14).
- In Leavenworth, the percentage of persons over 25 with a bachelor's degree (13 percent in 1990) is slightly less than the State's 14.2 percent (Table 14).

CONCLUSION

The data reviewed indicated several positive trends. Leavenworth County's population has been increasing since the 1940s. Recent population estimates indicate that the county's population is growing at a faster rate than Kansas'. Net Migration during the 1980s and 1990s are both positive. Average annual employment growth in Leavenworth County is higher than Kansas' during the last decade. Total employment grew a healthy 9.8 percent during 1991-1996 compared with 9.1 percent for the Kansas. Agricultural services, manufacturing, construction, and services sectors experienced strong job growth during that period. Government and governmental services, services, and retail trade sectors remain the top employers in the county. These three sectors accounted for 76.4 percent of total employment in 1986, which decreased slightly to 75.2 percent in 1996. Leavenworth County's average wage is much greater than the state average and is slightly less than U.S. average wage in 1996. Leavenworth County's over 25 population, in general, has a better level of education than the State, according to 1990 census data.

Other data reviewed show some trends that may be of concern to the county. The unemployment rate of 4.4 percent is higher than the state's 3.8 percent unemployment rate in 1997. The labor force participation and unemployment rates for Leavenworth County suggest that the county may have difficulty with supplying workers when additional jobs are created. Leavenworth County's per capita personal income lag behind the State's figures. The county trade pull factor indicates that the county loses business to its neighbors. The value of field crops in Leavenworth decreased an average of 33.3 percent from 1993 to 1996; similarly, the value of livestock and poultry declined an average of 11.8 percent during that same period.

As stated in the introduction, data alone do not lead to a well-founded understanding of the community. The intuition of those within the community as to what the trends really mean must also be considered. The actions taken now to address these challenges will influence the type of community Leavenworth County will be in the future.
